Shiliang Zhang

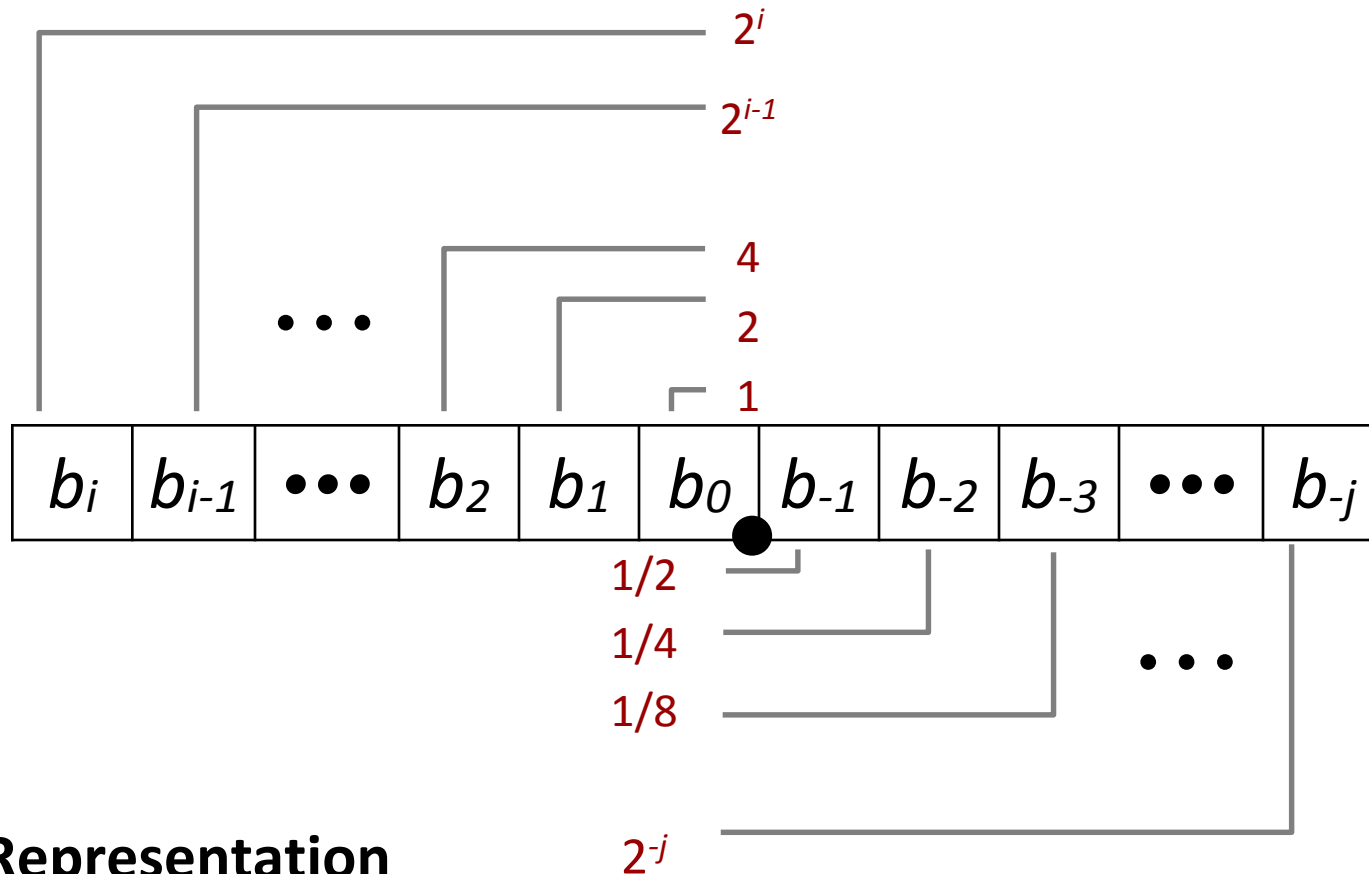

# Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

# Fractional binary numbers

- What is  $1011.101_2$ ?

# Fractional Binary Numbers

## ■ Representation

- Bits to right of “binary point” represent fractional powers of 2
- Represents rational number:

$$\sum_{k=-j}^i b_k \times 2^k$$

# Fractional Binary Numbers: Examples

## ■ Value Representation

$5 \frac{3}{4}$	$101.11_2$
$2 \frac{7}{8}$	$10.111_2$
$1 \frac{7}{16}$	$1.0111_2$

## ■ Observations

- Divide by 2 by shifting right (unsigned)
- Multiply by 2 by shifting left
- Numbers of form  $0.111111..._2$  are just below 1.0
  - $1/2 + 1/4 + 1/8 + \dots + 1/2^i + \dots \rightarrow 1.0$
  - Use notation  $1.0 - \epsilon$

# Representable Numbers

## ■ Limitation #1

- Can only exactly represent numbers of the form  $x/2^k$ 
  - Other rational numbers have repeating bit representations
- Value      Representation
  - $1/3$        $0.0101010101 [01] \dots_2$
  - $1/5$        $0.001100110011 [0011] \dots_2$
  - $1/10$       $0.0001100110011 [0011] \dots_2$

## ■ Limitation #2

- Just one setting of binary point within the  $w$  bits
  - Limited range of numbers (very small values? very large?)

# Today: Floating Point

- Background: Fractional binary numbers
- **IEEE floating point standard: Definition**
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

# IEEE Floating Point

## ■ IEEE Standard 754

- Established in 1985 as uniform standard for floating point arithmetic
  - Before that, many idiosyncratic formats
- Supported by all major CPUs

## ■ Driven by numerical concerns

- Nice standards for rounding, overflow, underflow
- Hard to make fast in hardware
  - Numerical analysts predominated over hardware designers in defining standard

# Floating Point Representation

## ■ Numerical Form:

$$(-1)^s M 2^E$$

- **Sign bit**  $s$  determines whether number is negative or positive
- **Significand**  $M$  normally a fractional value in range  $[1.0, 2.0)$ .
- **Exponent**  $E$  weights value by power of two

## ■ Encoding

- MSB  $s$  is sign bit  $s$
- exp field encodes  $E$  (but is not equal to  $E$ )
- frac field encodes  $M$  (but is not equal to  $M$ )

# Precision options

## ■ Single precision: 32 bits

## ■ Double precision: 64 bits

## ■ Extended precision: 80 bits (Intel only)

# “Normalized” Values

$$v = (-1)^s M 2^E$$

- When:  $\text{exp} \neq 000\dots 0$  and  $\text{exp} \neq 111\dots 1$
- Exponent coded as a *biased* value:  $E = \text{Exp} - \text{Bias}$ 
  - $\text{Exp}$ : unsigned value of exp field
  - $\text{Bias} = 2^{k-1} - 1$ , where  $k$  is number of exponent bits
    - Single precision: 127 (Exp: 1...254, E: -126...127)
    - Double precision: 1023 (Exp: 1...2046, E: -1022...1023)
- Significand coded with implied leading 1:  $M = 1.\text{xxx}\dots\text{x}_2$ 
  - xxx...x: bits of frac field
  - Minimum when frac=000...0 ( $M = 1.0$ )
  - Maximum when frac=111...1 ( $M = 2.0 - \epsilon$ )
  - Get extra leading bit for “free”

# Normalized Encoding Example

$$V = (-1)^s M 2^E$$

$$E = \text{Exp} - \text{Bias}$$

■ Value: `float F = 15213.0;`

$$15213_{10} = 11101101101101_2$$

$$= 1.1101101101101_2 \times 2^{13}$$

■ Significand

$$M = 1.\underline{1101101101101}_2$$

$$\text{frac} = \underline{11011011011010000000000}_2$$

■ Exponent

$$E = 13$$

$$\text{Bias} = 127$$

$$\text{Exp} = 140 = 10001100_2$$

■ Result:

# Denormalized Values

$$V = (-1)^S M 2^E$$

$$E = 1 - \text{Bias}$$

- Condition:  $\text{exp} = 000\dots 0$
- Exponent value:  $E = 1 - \text{Bias}$  (instead of  $E = 0 - \text{Bias}$ )
- Significand coded with implied leading 0:  $M = 0.\text{xxx}\dots\text{x}_2$ 
  - $\text{xxx}\dots\text{x}$ : bits of  $\text{frac}$
- Cases
  - $\text{exp} = 000\dots 0, \text{frac} = 000\dots 0$ 
    - Represents zero value
    - Note distinct values:  $+0$  and  $-0$  (why?)
  - $\text{exp} = 000\dots 0, \text{frac} \neq 000\dots 0$ 
    - Numbers closest to  $0.0$
    - Equispaced

# Special Values

- **Condition:  $\text{exp} = 111\dots 1$**
- **Case:  $\text{exp} = 111\dots 1$ ,  $\text{frac} = 000\dots 0$** 
  - Represents value  $\infty$  (infinity)
  - Operation that overflows
  - Both positive and negative
  - E.g.,  $1.0/0.0 = -1.0/-0.0 = +\infty$ ,  $1.0/-0.0 = -\infty$
- **Case:  $\text{exp} = 111\dots 1$ ,  $\text{frac} \neq 000\dots 0$** 
  - Not-a-Number (NaN)
  - Represents case when no numeric value can be determined
  - E.g.,  $\text{sqrt}(-1)$ ,  $\infty - \infty$ ,  $\infty \times 0$

# Visualization: Floating Point Encodings

# Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- **Example and properties**
- Rounding, addition, multiplication
- Floating point in C
- Summary

# Tiny Floating Point Example

## ■ 8-bit Floating Point Representation

- the sign bit is in the most significant bit
- the next four bits are the exponent, with a bias of 7
- the last three bits are the **frac**

## ■ Same general form as IEEE Format

- normalized, denormalized
- representation of 0, NaN, infinity

# Dynamic Range (Positive Only)

$$V = (-1)^s M 2^E$$

*n*:  $E = \text{Exp} - \text{Bias}$

*d*:  $E = 1 - \text{Bias}$

# Distribution of Values

## ■ 6-bit IEEE-like format

- $e = 3$  exponent bits
- $f = 2$  fraction bits
- Bias is  $2^{3-1}-1 = 3$

## ■ Notice how the distribution gets denser toward zero.

# Distribution of Values (close-up view)

## ■ 6-bit IEEE-like format

- $e = 3$  exponent bits
- $f = 2$  fraction bits
- Bias is 3

# Special Properties of the IEEE Encoding

- **FP Zero Same as Integer Zero**
  - All bits = 0
  
- **Can (Almost) Use Unsigned Integer Comparison**
  - Must first compare sign bits
  - Must consider  $-0 = 0$
  - NaNs problematic
    - Will be greater than any other values
    - What should comparison yield?
  - Otherwise OK
    - Denorm vs. normalized
    - Normalized vs. infinity

# Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- **Rounding, addition, multiplication**
- Floating point in C
- Summary

# Floating Point Operations: Basic Idea

- $x +_f y = \text{Round}(x + y)$
- $x \times_f y = \text{Round}(x \times y)$
- **Basic idea**
  - First **compute exact result**
  - Make it fit into desired precision
    - Possibly overflow if exponent too large
    - Possibly **round to fit into frac**

# Rounding

## ■ Rounding Modes (illustrate with \$ rounding)

■	<b>\$1.40</b>	<b>\$1.60</b>	<b>\$1.50</b>	<b>\$2.50</b>	<b>-\$1.50</b>
■ Towards zero	\$1	\$1	\$1	\$2	-\$1
■ Round down ( $-\infty$ )	\$1	\$1	\$1	\$2	-\$2
■ Round up ( $+\infty$ )	\$2	\$2	\$2	\$3	-\$1
■ Nearest Even (default)	\$1	\$2	\$2	\$2	-\$2

# Closer Look at Round-To-Even

## ■ Default Rounding Mode

- Hard to get any other kind without dropping into assembly
- All others are statistically biased
  - Sum of set of positive numbers will consistently be over- or under-estimated

## ■ Applying to Other Decimal Places / Bit Positions

- When exactly halfway between two possible values
  - Round so that least significant digit is even
- E.g., round to nearest hundredth

7.8949999	7.89	(Less than half way)
7.8950001	7.90	(Greater than half way)
7.8950000	7.90	(Half way—round up)
7.8850000	7.88	(Half way—round down)

# Rounding Binary Numbers

## ■ Binary Fractional Numbers

- “Even” when least significant bit is 0
- “Half way” when bits to right of rounding position =  $100..._2$

## ■ Examples

- Round to nearest  $1/4$  (2 bits right of binary point)

Value Value	Binary	Rounded	Action	Rounded
$2 \frac{3}{32}$	$10.00\textcolor{red}{011}_2$	$10.00_2$	( $<1/2$ —down)	2
$2 \frac{3}{16}$	$10.00\textcolor{red}{110}_2$	$10.01_2$	( $>1/2$ —up)	$2 \frac{1}{4}$
$2 \frac{7}{8}$	$10.11\textcolor{red}{100}_2$	$11.00_2$	( $1/2$ —up)	3
$2 \frac{5}{8}$	$10.10\textcolor{red}{100}_2$	$10.10_2$	( $1/2$ —down)	$2 \frac{1}{2}$

# FP Multiplication

■  $(-1)^{s1} M1 2^{E1} \times (-1)^{s2} M2 2^{E2}$

■ **Exact Result:**  $(-1)^s M 2^E$

- Sign  $s$ :  $s1 \wedge s2$
- Significand  $M$ :  $M1 \times M2$
- Exponent  $E$ :  $E1 + E2$

## ■ Fixing

- If  $M \geq 2$ , shift  $M$  right, increment  $E$
- If  $E$  out of range, overflow
- Round  $M$  to fit **frac** precision

## ■ Implementation

- Biggest chore is multiplying significands

# Floating Point Addition

■  $(-1)^{s1} M1 2^{E1} + (-1)^{s2} M2 2^{E2}$

■ Assume  $E1 > E2$

■ **Exact Result:**  $(-1)^s M 2^E$

■ Sign  $s$ , significand  $M$ :

▪ Result of signed align & add

■ Exponent  $E$ :  $E1$

Get binary points lined up

## ■ Fixing

■ If  $M \geq 2$ , shift  $M$  right, increment  $E$

■ if  $M < 1$ , shift  $M$  left  $k$  positions, decrement  $E$  by  $k$

■ Overflow if  $E$  out of range

■ Round  $M$  to fit **frac** precision

# Mathematical Properties of FP Add

## ■ Compare to those of Abelian Group

- Closed under addition? *Yes*
  - But may generate infinity or NaN
- Commutative? *Yes*
- Associative? *No*
  - Overflow and inexactness of rounding
  - $(3.14 + 1e10) - 1e10 = 0$ ,  $3.14 + (1e10 - 1e10) = 3.14$
- 0 is additive identity? *Yes*
- Every element has additive inverse? *Almost*
  - Yes, except for infinities & NaNs

## ■ Monotonicity

- $a \geq b \Rightarrow a + c \geq b + c$  *Almost*
  - Except for infinities & NaNs

# Mathematical Properties of FP Mult

## ■ Compare to Commutative Ring

- Closed under multiplication? *Yes*
  - But may generate infinity or NaN
- Multiplication Commutative? *Yes*
- Multiplication is Associative? *No*
  - Possibility of overflow, inexactness of rounding
  - Ex:  $(1e20 * 1e20) * 1e-20 = \text{inf}$ ,  $1e20 * (1e20 * 1e-20) = 1e20$
- 1 is multiplicative identity? *Yes*
- Multiplication distributes over addition? *No*
  - Possibility of overflow, inexactness of rounding
  - $1e20 * (1e20 - 1e20) = 0.0$ ,  $1e20 * 1e20 - 1e20 * 1e20 = \text{NaN}$

## ■ Monotonicity

- $a \geq b \ \& \ c \geq 0 \Rightarrow a * c \geq b * c$ ? *Almost*
  - Except for infinities & NaNs

# Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- **Floating point in C**
- Summary

# Floating Point in C

## ■ C Guarantees Two Levels

- `float`      single precision
- `double`      double precision

## ■ Conversions/Casting

- Casting between `int`, `float`, and `double` changes bit representation
- `double/float → int`
  - Truncates fractional part
  - Like rounding toward zero
  - Not defined when out of range or NaN: Generally sets to TMin
- `int → double`
  - Exact conversion, as long as `int` has  $\leq 53$  bit word size
- `int → float`
  - Will round according to rounding mode

# Floating Point Puzzles

## ■ For each of the following C expressions, either:

- Argue that it is true for all argument values
- Explain why not true

```
int x = ...;
float f = ...;
double d = ...;
```

Assume neither  
**d** nor **f** is NaN

- `x == (int)(float) x`
- `x == (int)(double) x`
- `f == (float)(double) f`
- `d == (double)(float) d`
- `f == -(-f);`
- `2/3 == 2/3.0`
- `d < 0.0`  $\Rightarrow$  `((d*2) < 0.0)`
- `d > f`  $\Rightarrow$  `-f > -d`
- `d * d >= 0.0`
- `(d+f)-d == f`

# Summary

- IEEE Floating Point has clear mathematical properties
- Represents numbers of form  $M \times 2^E$
- One can reason about operations independent of implementation
  - As if computed with perfect precision and then rounded
- Not the same as real arithmetic
  - Violates associativity/distributivity
  - Makes life difficult for compilers & serious numerical applications programmers

# Additional Slides

# Creating Floating Point Number

## ■ Steps

- Normalize to have leading 1
- Round to fit within fraction
- Postnormalize to deal with effects of rounding

## ■ Case Study

- Convert 8-bit unsigned numbers to tiny floating point format

Example Numbers

128	10000000
15	00001101
33	00010001
35	00010011
138	10001010
63	00111111

# Normalize

## ■ Requirement

- Set binary point so that numbers of form 1.xxxxx
- Adjust all to have leading one
  - Decrement exponent as shift left

<i>Value</i>	<i>Binary</i>	<i>Fraction</i>	<i>Exponent</i>
128	10000000	1.0000000	7
15	00001101	1.1010000	3
17	00010001	1.0001000	4
19	00010011	1.0011000	4
138	10001010	1.0001010	7
63	00111111	1.1111100	5

# Rounding

## ■ Round up conditions

- Round = 1, Sticky = 1  $\rightarrow$   $> 0.5$
- Guard = 1, Round = 1, Sticky = 0  $\rightarrow$  Round to even

<i>Value</i>	<i>Fraction</i>	<i>GRS</i>	<i>Incr?</i>	<i>Rounded</i>
128	1.000 <b>0000</b>	000	N	1.000
15	1.101 <b>0000</b>	100	N	1.101
17	1.000 <b>1000</b>	010	N	1.000
19	1.001 <b>1000</b>	110	Y	1.010
138	1.000 <b>1010</b>	011	Y	1.001
63	1.111 <b>1100</b>	111	Y	10.000

# Postnormalize

## ■ Issue

- Rounding may have caused overflow
- Handle by shifting right once & incrementing exponent

<i>Value</i>	<i>Rounded</i>	<i>Exp</i>	<i>Adjusted</i>	<i>Result</i>
128	1.000	7		128
15	1.101	3		15
17	1.000	4		16
19	1.010	4		20
138	1.001	7		134
63	10.000	5	1.000/6	64
